

Vision Box 2.0 by João Miranda Magic

In 2016 Joao Miranda invented Vision Box, his original take on the classic card to impossible location plot.

For the first time it was possible to perform an invisible switch not only to laymen but also to magicians.

The prediction is in full view from the first moment to the last, without any strange looking moves, the switch is accomplished.

Exactly four years later, Vision Box 2.0 is born and has several important technical details that have been improved regarding the first version:

Improvement 1: with vision box 2.0 the magician can really show a full card, fold it into quarters and place it inside the box. This by itself is a game changer since with other boxes of this type the piece is usually 2D and flat. Now it looks like a real prediction.

With Vision Box 2.0 the prediction inside has all the folds and looks like a real card, even from a very short distance.

Improvement 2: tiny built-in magnets in the base, making the prediction lock in place when placed inside the box. That way you don't need to be afraid of the piece moving from its position before the switch is made (by picking the box from the table for example)

Improvement 3: The lid is now 2x thicker, making it more resistant and much more secure in the top of the box, not falling out prematurely.

Improvement 4: New construction and building process, making a much more improved switch.

Improvement 5: Easier, faster and on the go reset with a new tool that makes you setup the box in less than 3 seconds (even in dark you can reset the gimmick).

"Vision Box 2.0 is unbelievable. I Highly recommend it."
