
Cube Sum by Gregorio Samà

The performer shows six dice. Each die has six faces of different colors and each colored face has a different two digit number on it. While the performer has his back turned, a spectator throws the dice on the table, and then randomly turns some of them over so that all of the colors on the faces are all different. When the performer turns around in just a fraction of a second, he is able to calculate the total of all six two digit numbers on the top faces.

But that's not all, As the performer will also be able to calculate the total of the top faces of the dice even if they are partially, or totally hidden from sight, and even before the dice are even thrown!

These wonderful dice can be used in both *Close-Up and Stage Performances* and are also adaptable for different styles of presentations(incredible instant calculation, clairvoyance, precognition). Each time the effect is performed, the total will always be different from the previous ones and the dice can be freely examined by the spectators.
