

## Chain Penetration - By Vincenzo Di Fatta

**This version, thanks to an ingenious idea by Vincenzo Di Fatta, allows everything to be examined... and the audience won't be able to uncover the secret!**

Two plates, each with a keyhole in the center, are mounted on a small stand. A metal chain is dropped from the top between the two plates. Then, a key is pushed into the central hole to block the chain's exit. However, just by pulling the chain upward, it will mysteriously melt through the key! This effect uses simple, everyday objects: a chain, a key, and two perforated plates. And you'll be able to make a metal chain pass right through a key!

- Easy to perform and finished with great attention to detail.
- The stand with the two plates is carefully crafted from Teak wood.
