Trinity by Mark Lemon

This tiny device does three things, and it does them all very well, allowing you to perform multiple effects with a borrowed phone.

With **Trinity,** you can create multiple-out predictions within the spectator's real Notes app.

Furthermore, you can use the spectator's phone to get a peek of something not even on their screen, while the phone remains in the spectator's hands.

Finally, you can even let your spectator search for anything on Google, Wikipedia or pretty much *any* website, and receive a covert peek on your phone or smartwatch. With zero trace left in their browser.

Very easy to learn and fun to perform with.

- Nothing to install on the spectator's phone
- No NFC tags or web pairing
- No fake websites or apps - works entirely with the real websites
- Quick setup, fully justified in performance
- Concealable device (24x21x13 mm / 0.9x0.8x0.5 inches)
- Simple single button operation
- All-day battery life
- Video tutorials and a quick start guide
- Bonus fourth feature added

Trinity

works with Marc Kerstein's - Bridge (less than $1 on the App Store) for notifications and seamless connections with a variety of other magic apps, peeks, output options and AI integrations.

Additional Information:

- USB-C Charging
- The performer's phone and the borrowed phone must both be iOS devices.
- Currently supports spectator iPhones using UK/US English, French,

German & Spanish.
* Bridge app required to receive notifications of spectator web searches.
