

Quiver by Kelvin Chow

Quiver is a revolutionary new switching device

that is disguised as a standard looking coin pouch.

Granting you the power to switch any small object for another automatically.

The second the wallet closes, it's DONE.

The most unbelievable part of **Quiver** is the fact that the spectator can open or close it themselves. They'll find nothing.

You can let your spectator freely handle the pouch with full confidence that they will never discover its devious secrets, no matter how hard they try.

Use **Quiver** For:

- Visual switches
- Predictions
- Object to impossible location
- Equivoque / Multiple Outs

"Kelvin's attention to detail and persistence to make the best quality tools is superb. I am proud to use your products."
